Texmaker version 4.0 has been released on March 8, 2013. Now the free cross-platform LaTeX editor bases on Qt5, the latest version of the Qt library which has been released on December 19, 2012.

Enhancements in this version, from the ChangeLog file: **TEX MAKER**

- Qt5 support (still compilable with Qt>=4.7.2)
- New ctrl+shift+F2 keyboard shortcut for toggling between the master document and the current document
- Now the continuous mode of the internal PDF viewer is no more automatically enabled after a new compilation
- Unix and Mac OS X users can add an option in the configuration dialog to the lp command (for printing in the internal PDF viewer)
- A special "quick build command" for Asymptote (.asy) files: if the current document has an .asy extension, with the F1 shortcut this command will be used instead of the standard "quick build command" for the .tex documents; while using the "user tags", @@ will now be replaced by single @

Several bugs have been fixed: compilation trouble with gcc 4.8, a problem with the insertion of an user tag by using a keyboard trigger, and the column count has been corrected.

The complete ChangeLog can be found [here](#) . Click [here](#) for downloading versions for Linux, Mac OS X or Windows or source files.
